

1. (Currently Amended) A system for printing target data from a web application used through a browser of a client computer that is operatively connected to a web server providing the web application comprising:

- a client computer having a browser for using the web application;
- a web server for providing the web application;
- a web application content for providing the web application on said browser;
- a personal imaging repository for storing imaging data associated with a user profile; and
- a print destination server ~~specified~~ selected by ~~[[the]]~~ a user for printing the target data; and

~~wherein the web application content directs the browser to said print destination server and transfer data to said personal imaging repository responsive to user print selection~~

in responsive to the user print destination server selection for the printing the target data, the web application content is executed to:

- create a Universal Resource Locator (URL) request,
- send said URL request to said web server, and said web server constructs the imaging data of the target data in response to said URL request,
- transfer the imaging data to the personal imaging repository for storing therein, and
- after the image data is stored in the personal imaging repository, direct the browser to said print destination server; and
- said print destination server prints the target data according with user specified print configuration.
